RISK CRITERIA

Out of hospital delivery is a safe option for a low risk woman with an essentially normal pregnancy. At the initial visit, at the end of each trimester and upon admission in labor, the midwife evaluates the patient's risk status with respect to the criteria specified in the Practice Guidelines. Women with certain conditions may not be eligible for out-of-hospital delivery in our program of care. In some cases, care can be co-managed by the midwife and obstetrician; in other cases, transfer to physician may be necessary. The conditions requiring co-management or transfer include but are not limited to:

Obesity with BMI > 45

Certain congenital or acquired heart

diseases or conditions

Deep vein thrombosis at term

HIV positive blood test, AIDS or AIDS

related complex

Certain renal diseases

Seizure disorder requiring medication with

seizure activity in the last 2 years

Hemolytic anemia

Drug addiction

Uncontrolled asthma

Hematologic disease

Diabetes, class A or greater

Uncontrolled thyroid disorder

Uncontrolled hypertension

Previous Caesarian delivery – primary or

secondary VBAC

Surgery involving uterine wall, other than

C-section

Significant uterine myomata

Significantly abnormal Pap smear

Incomplete spontaneous abortion

Ectopic pregnancy

Complete placenta previa or partial previa

after 25 weeks

Severe polyhydramnios or

oligohydramnios Isoimmunization

Multiple gestation

Severe intrauterine growth restriction

Certain congenital defects

Thrombocytopenia

Moderate to severe pre-eclampsia (PIH)

Malpresentation in labor

Preterm labor less than 36 weeks

gestation

Postdates greater than 42 weeks gestation

Prolonged rupture of membranes per

protocol

Previous postpartum hemorrhage greater

than 1000 cc

Syphilis, Hepatitis B or Hepatitis C positive

Medical conditions requiring medication

and physician supervision

Certain psycho-social issues that would

benefit from additional support or

resources not available through Birth

Care
